

So we can catch the DNA! and if one method like photosynthesis does not work we do scientific solutions! so we gather green energy from the 3 gen and get enough DNA & RNA to make dinosaurs alive today!!

later & finally!.....

I wonder what bone of this belongs to what dinosaur

ohh I almost forgot, "chemosyntheses v. photosyntheses."

like what people poop
could be digested
in the ground and
break down into
something that does
not contain NH_4^+
- called chemosyntheses.

and what the
sun give off heat
and giving H_2O
called photosyntheses.

AND Here's a question - "why chemosyntheses may
be more likely to support life on distant
worlds than photosyntheses."
