## My Daily News

Do you ever know why is there a full moon? Actually there are different types of moon orbits.

1) New moon; the moon that has completely faced away from the sun.

2) Crescent moon; little part of a full moon.

3) Quarter moon; when the moon looks like a half circle.

4) Gibbous moon; quarter and a half of a full moon.

5) Full moon; the most amount of sun light is shined on the moon creates a full moon.
